<i>Introduction</i>	xv
A GLOBAL VIEW	1
1 Making decisions: a difficult problem	3
1.1 Interventions, actions and decisions	5
1.1.1 A first example: the Egyptian Water Plan	5
1.1.2 A second example: controlling hydraulic risk	8
1.1.3 Actions and decisions	9
1.1.4 Classifying actions	10
1.2 Difficulties and keys to their solutions	12
1.2.1 Participation	14
1.2.2 Integration	16
1.2.3 Rationalization	17
1.3 Planning: the PIP procedure	18
1.3.1 The phases	20
1.3.2 Remarks	28
1.3.3 The Project scheme	30
1.3.4 Evaluating Alternative Zero	35
1.4 Management	36
1.5 Monitoring	36
2 From the decision-making procedure to MODSS	37
2.1 Planning and management	37
2.1.1 Planning the management	38
2.1.2 Designing the management	44
2.1.3 Generalizations	44
2.2 Decision making under full rationality conditions	45
2.2.1 In a deterministic world	46
2.2.2 In an uncertain world	48
2.3 Decision making under partial rationality conditions	51
2.3.1 Negotiations	57
2.3.2 The MODSS	59
2.3.3 Many objectives, one Decision Maker	60
2.4 Managing	60
2.5 The steady-state paradigm	60
2.6 The decision-making levels	61
2.7 Functions and architecture of a MODSS	63

2.7.1	The levels of the MODSS	63
2.7.2	Functions	64
2.7.3	Architecture	65
2.8	Organization of the book	68
B	THE ELEMENTS OF THE PROBLEM	71
3	Actions, criteria and indicators	73
3.1	From Reconnaissance to actions	73
3.2	Criteria and indicators	78
3.2.1	Index and indicators	79
3.2.2	Properties of the criteria	83
3.2.3	Factors influencing indicator choice	84
3.2.4	Validation of the indicators	86
3.3	An example: the Egyptian Water Plan	88
3.4	Project and sector indices	90
4	Systems, models and indicators	95
4.1	From the water system to its model	95
4.1.1	From the system to its components	97
4.1.2	From the component to its model	99
4.2	Bayesian Belief Networks	108
4.3	Mechanistic models	111
4.3.1	Stochastic models	112
4.4	Empirical models	113
4.5	Data-Based Mechanistic models	116
4.6	Models of the disturbances	119
4.7	Markov chains	122
4.8	The time step	124
4.9	The modelling process	126
4.9.1	Conceptualization of the system	127
4.9.2	Calibration	128
4.9.3	Validation	129
4.10	The indicators	129
4.10.1	Form	129
4.10.2	Random indicators	131
4.10.3	Identification of the indicators	133
4.11	Stationary or non-stationary?	134
4.12	Realization and state estimation	135
4.13	Conclusion	136
5	Modelling the components	137
5.1	Reservoirs	138
5.1.1	The causal network	139
5.1.2	The mechanistic model	140
5.1.3	The set of feasible controls	146
5.1.4	The time step and the time constant	149
5.1.5	The model of the reservoir	151

5.2	Catchments	152
5.2.1	The block diagram	153
5.2.2	Mechanistic models	155
5.2.3	Empirical and Data-Based Mechanistic models	156
5.3	Canals	160
5.3.1	The causal network	161
5.3.2	Mechanistic models	161
5.3.3	Empirical and Data-Based Mechanistic models	166
5.3.4	The step indicator	167
5.4	Diversion dams	168
5.4.1	The causal network	168
5.4.2	Mechanistic models	168
5.5	Confluence points	169
5.6	Stakeholders	170
5.6.1	Hydropower plants	170
5.6.2	Irrigation districts	175
5.7	Disturbance	183
5.7.1	Empirical models	184
6	Aggregated models	185
6.1	Identification procedure	185
6.1.1	Decomposing the system	185
6.1.2	Choosing the time step	189
6.1.3	Identifying the models of the components	189
6.1.4	Aggregating the components	196
6.1.5	Remarks	199
6.2	The global model	200
6.2.1	Verifying the time step	202
6.3	The distribution network	203
6.4	More about disturbances	207
6.4.1	Generating synthetic series	207
6.4.2	A reversible hydropower plant	208
6.4.3	Random disturbances per-period	214
C	DECISION MAKING IN FULL RATIONALITY CONDITIONS	217
7	Identifying the optimal alternative	219
7.1	Why the Problem is difficult	220
7.1.1	Infinite alternatives	220
7.1.2	Uncertainty of the effects	220
7.1.3	Recursive decisions	221
7.2	Organization of Part C	221
8	Choosing among infinite alternatives	223
8.1	The elements of the Planning Problem	223
8.1.1	The system model	223
8.1.2	The design indicator	224
8.1.3	The design scenario	228

8.2	Formulating the Problem	231
8.3	Example: the Sinai Plan	235
8.3.1	Reconnaissance	235
8.3.2	Phase 1: Defining Actions	235
8.3.3	Phase 2: Defining Criteria and Indicators	238
8.3.4	Phase 3: Identifying the Model	240
8.3.5	Phase 4: Designing Alternatives	241
9	Dealing with risk and uncertainty	243
9.1	Risk and uncertainty	243
9.1.1	The Laplace criterion	243
9.1.2	The Wald criterion	244
9.1.3	Risk aversion and utility functions	245
9.2	Chance constraints	248
9.3	The Pure Planning Problem under risk or uncertainty	249
9.4	Solution	251
10	Planning the management	253
10.1	The policy	253
10.1.1	Point-valued (PV) and set-valued (SV) policies	254
10.1.2	On-line and off-line policies	256
10.1.3	When is a policy useful?	257
10.2	The elements of the Design Problem	258
10.2.1	The time step	258
10.2.2	The indicator	258
10.2.3	The objective	263
10.2.4	The design scenario	264
10.3	The Design Problem with PV policies	265
10.3.1	Characteristics of the solution	267
10.3.2	Approaches to the solution	268
10.4	A Law of Duality: from Laplace to Wald	271
10.5	Discretization	271
10.5.1	Classes of state	271
10.5.2	Classes of control	272
10.5.3	Classes of deterministic disturbance	272
10.5.4	Classes of random disturbance	273
10.5.5	The discretized model	273
10.5.6	The control law as a matrix	274
11	The Design Problem with SV policies	277
11.1	Markov chains	277
11.1.1	Stochastic disturbances	277
11.1.2	Uncertain disturbances	278
11.2	The Design Problem with SV policies	280
11.2.1	From the PV to the SV Design Problem	280
11.2.2	Formulating the SV Design Problem	282
11.3	Cascade criteria	284

12	Off-line non-learning-based policies	287
12.1	PV policies: Functional Design	289
12.1.1	The optimal cost-to-go	289
12.1.2	Stochastic Dynamic Programming	293
12.1.3	Computational complexity	295
12.1.4	Algorithms	298
12.1.5	Policy and Bellman function	305
12.1.6	Examples	306
12.2	PV policies: Parametric Design	306
12.2.1	The curse of dimensionality	306
12.2.2	Linear Quadratic Gaussian	308
12.2.3	Fixed-class costs-to-go: Neural Stochastic Dynamic Programming	312
12.2.4	Fixed-class policies	317
12.3	SV policies: Functional Design	321
12.3.1	Examples	321
13	Off-line learning policies	323
13.1	Reinforcement Learning	324
13.2	From SDP to Q -learning	326
13.2.1	The Q -factor	326
13.3	Model-free Q -learning	329
13.3.1	The learning rate	332
13.4	Partially model-free Q -learning	333
13.4.1	On-line learning	338
13.5	SV policies	338
14	On-line policies	341
14.1	On-line design and reduced state	342
14.1.1	State reduction	344
14.2	Adaptive policies	347
14.3	Forms of On-line Problems	349
14.3.1	Naive Feedback Control	349
14.3.2	Open-Loop Feedback Control	350
14.3.3	Partial Open-Loop Feedback Control	351
14.3.4	An example: application to the Verbano Project	352
14.4	SV policies	357
14.5	Variable-frequency regulation	357
15	Distribution policies	361
15.1	Control Problem for distribution policies	363
15.2	Solution algorithms	367
D	DECISION MAKING IN PARTIAL RATIONALITY CONDITIONS	371
16	The decision-making process	373
16.1	Multiple objectives: from Designing Alternatives to Evaluation	375
16.2	Multiple Decision Makers: Comparison and Final Decision	376
16.3	Mitigation and Compensation	376

16.4	Organization of Part D	377
17	Choosing the decision-making method	379
17.1	Rankings and ordinal scales	379
17.1.1	Arrow's Theorem	381
17.1.2	Absolute and interval scales	383
17.2	Preference axioms	384
17.3	Multi-Attribute Value Theory	385
17.4	Analytic Hierarchy Process	386
17.5	ELECTRE methods	389
17.6	Choice of the method	391
18	Identifying efficient alternatives	395
18.1	Multi-Objective Design Problems	395
18.2	Pareto Efficiency	396
18.3	Determining the Pareto-efficient decisions	399
18.3.1	Lexicographic Method	400
18.3.2	Weighting Method	402
18.3.3	Reference Point Method	405
18.3.4	Constraint Method	409
18.3.5	Choosing the method	410
18.4	Preferences among the objectives	411
18.5	An example: the Sinai Plan	411
18.5.1	Phase 2: Defining Criteria and Indicators	411
18.5.2	Phase 4: Designing Alternatives	412
18.6	Choosing the objectives	413
18.7	Discretizing the alternatives	416
19	Estimating Effects	419
19.1	Markov simulation	420
19.1.1	The Regulator's behaviour	421
19.1.2	Uncertain disturbances	423
19.1.3	Stochastic disturbances	424
19.2	Deterministic and Monte Carlo simulations	426
19.2.1	Choosing the simulation series	427
19.2.2	The Regulator's Model	429
19.3	The evaluation scenario	430
19.4	Validating the indicators	431
19.5	Matrix of the Effects	432
20	Evaluation	433
20.1	MAVT: basic assumptions	433
20.2	MAVT: utility functions and value functions	434
20.2.1	The global value function	434
20.2.2	Indifference curves	434
20.2.3	Identifying the preference structure	435
20.3	Mutual preferential independence	437
20.3.1	Two indicators	437

20.3.2	Many indicators	438
20.4	Identifying partial value functions	440
20.4.1	The midvalue splitting method	440
20.4.2	The significant points method	442
20.4.3	Remarks	443
20.5	Excluding dominated alternatives	444
20.6	Identifying the global value function	444
20.6.1	Two-dimensional value functions	445
20.6.2	Multidimensional value functions	447
20.6.3	Pairwise comparison and hierarchies	448
20.7	Uncertainty in the Evaluation	450
20.7.1	Sensitivity analysis	451
20.8	Beyond MAVT	452
21	Comparison, negotiations and the Final Decision	453
21.1	How to negotiate	454
21.2	What to negotiate	455
21.3	Step-by-step negotiations vs negotiations on rankings	458
21.4	Negotiations on weights	461
21.4.1	Definition of distance	462
21.5	Negotiations on thresholds	464
21.5.1	The Elementary Negotiation Procedure	465
21.6	Voting on rankings	469
21.7	Mediation suggestions	470
21.7.1	Maimonides point	472
21.7.2	Equipop point	473
21.7.3	Balanced-Increment point	473
21.7.4	Nash point	475
21.7.5	Solutions from Game Theory	476
21.8	Organizing the meetings	478
22	Mitigation and Compensation	479
22.1	Mitigation measures	479
22.2	Compensation measures	480
22.3	Mitigation and Compensation in the decision-making process	481
23	How to cope with uncertainty: recapitulation	483
23.1	Decision-making problems: a classification	483
23.1.1	Sources of uncertainty in decision-making problems for water re- sources planning and management	485
23.1.2	Sources of uncertainty	489
23.2	Classifying and modelling uncertainty	490
23.2.1	Quantifiable uncertainty	490
23.2.2	Non-quantifiable uncertainty	493
23.3	Handling uncertainty in the decision-making process	493
23.3.1	Single-DM Single-Objective Problem	494
23.3.2	Single-DM Multi-Objective Problem	494
23.3.3	Multi-DM Multi-Objective Problem	495
